

Bridging continents through trade, partnership, and shared prosperity

Confidential and Proprietary
August 2026

Foreword

The Dominican Republic is the largest economy in the Caribbean and one of the most dynamic in Latin America, anchored by a mature tourism sector, an internationally competitive free trade zone regime, expanding mining and agro-industrial output, and a strategic geographic position at the crossroads of North American, Latin American, and European trade routes. India, for its part, brings globally competitive strengths in pharmaceuticals, generic medicines, information technology, agricultural machinery, automotive components, renewable energy equipment, and business process services. The complementarity between the two economies is substantial and, to date, underutilised.

This Knowledge Paper has been prepared as a working document for CCI India's member companies, for government stakeholders in India, and for the Embassy of the Dominican Republic in New Delhi. It examines the Dominican Republic's economic and business environment in depth, reviews the current state of India-Dominican Republic relations, analyses priority sectors identified in our discussions with the Ambassador, including pharmaceuticals, healthcare, agriculture and farm machinery, logistics, cocoa, cigars, textiles, tourism, and manufacturing, and sets out a detailed roadmap for the role CCI India can play in translating diplomatic goodwill into commercial outcomes.

CCI India is committed to serving as an institutional bridge between Indian industry and the Dominican Republic, through business delegations, buyer-seller meets, investment forums, sector-specific missions, and sustained policy dialogue with both governments. We believe the recommendations contained in this paper offer a practical and actionable framework for deepening trade, investment, and technology cooperation between our two nations over the coming years.

We extend our sincere appreciation to H.E. Francisco Compres H. and the Embassy of the Dominican Republic in India for their partnership in this endeavour, and we look forward to working closely with the Embassy, the Government of India, and our member industries to realise the substantial opportunities that this relationship holds.

A handwritten signature in black ink, appearing to read "Munindra Kumar".

Munindra Kumar

CONCLUSION	62

DOMINICAN REPUBLIC

“ Go beyond the resorts and experience authentic local life

Basic Facts, Demographics, and Monetary

System: The Dominican Republic is located in the Caribbean, occupying the eastern part of the island of Hispaniola, which it shares with Haiti. Its capital is Santo Domingo, the official language is Spanish, and the national currency is the Dominican Peso (DOP). The country has a population of approximately 11.5 million people

and is one of the largest economies in the Caribbean. It has a relatively young and urbanizing population, with major cities like Santo Domingo and Santiago serving as key economic and cultural centers. The Dominican Peso is influenced by tourism revenues, remittances, and trade flows, supported by stable monetary policies.

Economic Landscape and Gross Domestic Product (GDP)

The Dominican Republic has one of the fastest-growing economies in Latin America and the Caribbean, with a nominal GDP of around USD 124-127 billion. Its economy is driven by tourism, manufacturing (especially free trade zones), mining, agriculture, construction, and services. Tourism is a major pillar, attracting millions of visitors annually, while manufacturing zones produce textiles, electronics, and medical devices for export. The country has shown strong economic resilience supported by investment, infrastructure development, and trade openness.

The primary sectors contributing to the GDP are:

- ◆ **Agriculture:** Sugar, coffee, cocoa, tobacco, rice, bananas, avocados, and fruits remain important.
- ◆ **Services:** Tourism, trade, transport, finance, and communications dominate GDP.
- ◆ **Industry:** Includes manufacturing, mining (gold, ferronickel, nickel), construction, and energy..

“Culture and Heritage

The Dominican Republic has a rich cultural identity shaped by Spanish, African, and Indigenous Taíno influences. It is globally known for music styles such as merengue and bachata, vibrant festivals, and colorful traditions. Its cultural heritage is reflected in dance, cuisine, art, and historic architecture, particularly in Santo Domingo, one of the oldest cities in the Americas.

Import and Export from India

India exports a wide range of goods to the Dominican Republic, including pharmaceuticals, vehicles, machinery, chemicals, textiles, and engineering products that support critical sectors such as healthcare, infrastructure, manufacturing, and consumer markets. These exports play an important role in meeting the country's demand for affordable medicines, industrial equipment, and finished goods. In return, India imports gold, medical devices, electrical equipment, tobacco, and cocoa, tobacco and niche agricultural products from the Dominican Republic. This trade pattern highlights a complementary relationship, where India supplies value-added manufactured goods while the Dominican Republic contributes mineral resources and specialized export products.

Economic Ties

India and the Dominican Republic share warm and steadily expanding economic ties built on trade, industrial cooperation, and mutually beneficial market strengths. India's exports help support the Dominican Republic's industrial development, healthcare systems, and infrastructure needs, while the Dominican Republic provides valuable minerals and niche export goods to Indian markets. Beyond trade, both countries are increasingly exploring collaboration in renewable energy, healthcare, digital technology, infrastructure, pharmaceuticals and ICT development, creating a stronger foundation for long-term economic partnership and investment.

Key Players in Import and Export

Major Indian export players include pharmaceutical companies, automobile manufacturers, machinery exporters, textile producers, and chemical firms that cater to the Dominican Republic's growing industrial and consumer demand. On the Dominican Republic's side, key export players include mining companies involved in gold production, medical device manufacturers, tobacco and cigar producers, and agricultural exporters supplying global markets.

Culture and People-to-People Ties

People-to-people ties between India and the Dominican Republic are growing through diplomatic goodwill, cultural exchange, and educational engagement. Indian culture—such as yoga, cuisine, and films—is gradually gaining visibility, while Dominican music, dance, and cultural traditions are globally recognized.

Chapter 1: Dominican Republic at a Glance

1.1 Geography

The Dominican Republic occupies the eastern two-thirds of the island of Hispaniola in the Greater Antilles, sharing its western land border with the Republic of Haiti. It is the second-largest country in the Caribbean by land area, covering approximately 48,670 square kilometres, and is bordered by the Atlantic Ocean to the north and the Caribbean Sea to the south. The country's terrain is markedly varied for its size, encompassing the Cordillera Central mountain range, home to Pico Duarte, the highest peak in the Caribbean, as well as fertile lowland valleys such as the Cibao Valley, extensive coastal plains, and over 1,600 kilometres of coastline that underpin its tourism industry. The capital, Santo Domingo, situated on the southern coast, is the oldest continuously inhabited European-founded city in the Americas and remains the country's principal political, financial, and commercial centre.

The country's geographic position, at the centre of the Caribbean basin and in close proximity to the United States, Puerto Rico, and the wider Central American and South American markets, gives it strategic relevance as a logistics and re-export hub. This positioning, combined with the country's free trade zone regime and its preferential trade access to North America, is central to the case for the Dominican Republic as a platform for Indian goods seeking wider Caribbean and Central American market access.

1.2 Political System

The Dominican Republic is a representative, unitary, and democratic republic with a presidential system of government, structured around three constitutionally separated branches: executive, legislative, and judicial. The President serves as both head of state and head of government, is elected by direct popular vote for a four-year term, renewable once consecutively, and appoints the Cabinet, provincial governors, and senior officials of the executive branch. The current President, Mr. Luis Abinader of the Partido Revolucionario Moderno (Modern Revolutionary Party, PRM), first took office in August 2020 and secured re-election in the general election of May 2024 with a decisive first-round majority, beginning his second term in August 2024.

The National Congress is bicameral, comprising the Chamber of Deputies and the Senate, both elected for four-year terms concurrent with the presidential term. Following the 2024 elections, the governing PRM holds a substantial majority in both chambers, providing the Abinader administration with a strong legislative mandate.

The judiciary is headed by the Supreme Court of Justice, with a Constitutional Court exercising jurisdiction over constitutional matters. The Dominican Republic has held regular, competitive, and internationally recognised elections since the mid-1990s, and its institutional stability, particularly relative to several regional peers, is regarded by international investors as a favourable feature of the country's business environment.

1.3 Administrative Structure

The Dominican Republic is administratively divided into 31 provinces and the National District (Distrito Nacional), which contains the capital, Santo Domingo, and functions as a separate administrative unit. Provinces are further subdivided into municipalities and municipal districts, each governed by an elected mayor and municipal council. Provincial governors are appointed by the President and serve as the executive representative of the national government at the provincial level, working alongside elected municipal authorities. This structure combines a strong central government, in which policy formulation, taxation, and major infrastructure decisions are concentrated, with a layer of municipal governance responsible for local services.

For business planning purposes, the most economically significant administrative and metropolitan areas are the National District and Greater Santo Domingo, which together account for the largest concentration of population, financial services, and corporate headquarters; Santiago de los Caballeros and the Cibao region in the north, the country's principal agro-industrial and manufacturing corridor; and the eastern provinces of La Altagracia and La Romana, home to Punta Cana and the country's dominant tourism cluster.

1.4 Economy

The Dominican Republic is the largest economy in the Caribbean and among the fastest-growing in Latin America, with nominal GDP estimated at approximately USD 128 to 138 billion. Between 2010 and 2019, the economy averaged annual growth in excess of 5 percent, before contracting sharply during the COVID-19 pandemic and then rebounding strongly, expanding by over 12 percent in 2021. Growth moderated thereafter amid tighter global monetary conditions, registering approximately 2.1 percent in 2025, with the World Bank projecting a reacceleration to approximately 3.6 percent in 2026 and 4.4 percent in 2027, driven by a rebound in private investment, construction activity, resilient consumption supported by remittance inflows, and continued strength in tourism and gold exports.

The economy is structurally diversified relative to many regional peers, with services, including tourism, financial services, telecommunications, and free trade zone operations, accounting for the majority of output; industry, including mining, manufacturing, and construction, forming a substantial secondary pillar; and agriculture remaining significant for employment and food security despite its smaller relative share of GDP. The Dominican Republic is a member of the World Trade Organization and a party to the Dominican Republic-Central America Free Trade Agreement (CAFTA-DR), which grants preferential access to the United States market, the country's largest trading partner. Public debt has risen in recent years, reaching approximately 58 percent of GDP in 2025, and the fiscal deficit has widened, factors that the Dominican authorities are actively managing through revenue administration reforms and expenditure discipline.

Foreign direct investment has been a consistent strength of the Dominican economy, with annual inflows exceeding USD 4 billion in recent years, directed principally toward tourism, free trade zones, real estate, energy, and telecommunications. The Central Bank of the Dominican Republic (Banco Central de la Republica Dominicana, BCRD) manages monetary policy and has maintained relative exchange rate stability, supported by strong foreign exchange inflows from tourism, remittances, and foreign direct investment.

1.5 Demographics

The Dominican Republic has a population of approximately 11.3 million, making it the second most populous country in the Caribbean after Cuba. The population is predominantly urban, with over three-quarters of Dominicans residing in cities, and Greater Santo Domingo alone accounting for a substantial share of the national population. The country has a comparatively young demographic profile, with a median age in the late twenties, a structural advantage for labour supply and domestic consumption growth relative to more demographically mature economies in the region.

Spanish is the official and dominant language, and the education system has expanded significantly over the past decade, supported by increased public investment in schooling. English proficiency is relatively developed within the tourism, free trade zone, and business services sectors due to sustained exposure to the United States market, a factor that eases commercial engagement for foreign investors. Poverty has declined substantially over the past two decades, with the official poverty rate falling to approximately 17.3 percent in 2025, and the middle class now exceeding the poor population in size, reflecting broad-based improvements in living standards even as income inequality remains a policy concern.

1.6 Infrastructure

The Dominican Republic possesses one of the more developed infrastructure networks in the Caribbean, reflecting sustained public and private investment over the past two decades. The country is served by multiple international airports, of which Punta Cana International Airport is the busiest, handling the large majority of international tourist arrivals, and Las Americas International Airport near Santo Domingo serves as the principal gateway for the capital and business travel. Additional international airports operate in Santiago, Puerto Plata, and La Romana, providing multiple points of entry for cargo and passenger traffic.

The maritime and logistics sector is anchored by the Multimodal Caucedo port, one of the largest transshipment hubs in the Caribbean and Central America, alongside the Port of Haina, historically the country's principal commercial port, and additional facilities serving the tourism cruise segment. This port infrastructure, combined with the country's network of free trade zones, positions the Dominican Republic as a logistics platform for goods moving between North America, the Caribbean, and, increasingly, South America. Road infrastructure has expanded substantially, including toll highways connecting Santo Domingo to Santiago and the eastern tourism corridor, though rural road quality and last-mile connectivity remain areas identified for continued investment. The energy sector has diversified in recent years, with growing investment in renewable generation, including solar and wind capacity, alongside the country's traditional dependence on imported fossil fuels, a dependence that remains a structural vulnerability and a specific area in which Indian renewable energy technology and expertise present cooperation opportunities discussed later in this paper.

Chapter 2: India-Dominican Republic Relations

India and the Dominican Republic marked twenty-five years of formal diplomatic relations in 2024, a milestone that has coincided with a deliberate deepening of institutional engagement between the two countries. This chapter reviews the diplomatic, trade, investment, and cooperation dimensions of the relationship, and identifies the areas in which CCI India can contribute to its continued expansion. In recent years, both countries have increased high-level diplomatic exchanges, strengthened cooperation through multilateral forums, and explored new opportunities in trade, investment, renewable energy, healthcare, education, tourism, and information technology. This growing engagement reflects a shared commitment to expanding bilateral cooperation and fostering long-term economic and institutional partnerships.

2.1 Diplomatic Relations

Formal diplomatic relations between India and the Dominican Republic were established in 1999. For much of the following two decades, the relationship was sustained principally through non-resident accreditation and the efforts of the Dominican Republic's honorary diplomatic representation in India, including the contribution of the late Ambassador Hans Dannenberg Castellanos, who established the Dominican mission in India and served as Dean of the Diplomatic Corps. The relationship entered a more structured phase from 2020 onward, when the Union Cabinet of India approved the opening of a resident Indian Embassy in Santo Domingo, a decision that reflected India's broader strategy of expanding its diplomatic footprint across the Caribbean and Latin America.

High-level engagement has intensified in recent years. External Affairs Minister Dr. S. Jaishankar addressed the twenty-fifth anniversary of bilateral relations in 2024, underscoring the growing trade and economic ties between the two countries and expressing appreciation for the Dominican Republic's support during Operation Indravati, India's evacuation of its nationals from Haiti through Dominican territory amid Haiti's political crisis. On the Dominican side, the appointment of H.E. Francisco Compres H., a career diplomat, as Ambassador to India has been accompanied by an active bilateral agenda encompassing trade promotion, multilateral cooperation, renewable energy, climate resilience, business facilitation, and academic exchange. India's resident Ambassador to the Dominican Republic has similarly pursued an active trade-oriented mandate, including public calls to reduce the country's reliance on third-country intermediaries in bilateral trade.

2.2 Trade Relations

Bilateral trade between India and the Dominican Republic has grown substantially over the past decade, though from a modest base. Total trade stood at approximately USD 431.57 million in the 2014-15 financial year, with India recording a trade deficit as Dominican exports, principally gold, exceeded Indian exports to the market. By the 2021-22 financial year, two-way trade had surged to approximately USD 959 million, a growth of 106 percent, with Indian exports to the Dominican Republic rising by 48 percent to approximately USD 310 million. According to the Embassy of the Dominican Republic in India, bilateral trade reached a record level of over USD 1.1 billion in 2024, sustaining the decade-long growth trend.

India's principal exports to the Dominican Republic include pharmaceuticals, generic medicines, vehicles and automotive components, textiles and garments, chemicals, and engineering goods. Dominican exports to India are concentrated in gold, iron and steel products, medical instruments, tobacco, and other primary goods.

This trade pattern reflects the underlying complementarity between the two economies, an industrially diversified, manufacturing-oriented Indian economy trading with a Dominican economy strong in mining output, tourism-linked services, and free trade zone assembly operations, but it also reveals a trade structure still dominated by a narrow set of product categories, with substantial room for diversification into pharmaceuticals, healthcare products, agricultural machinery, and industrial equipment.

A significant structural distortion has been publicly identified by Indian diplomatic officials: a substantial volume of Indian-manufactured goods reaches the Dominican market indirectly, through third-country trade routes and intermediaries, rather than through direct bilateral trade channels. This indirect routing inflates logistics costs for Dominican importers, understates the true scale of India-Dominican Republic commercial engagement in official trade statistics, and dilutes India's price competitiveness relative to direct suppliers. Addressing this distortion through direct trade facilitation is one of the clearest near-term opportunities for both governments and for institutional trade bodies such as CCI India.

2.3 Investment

Formal investment flows between India and the Dominican Republic remain limited relative to the scale of trade, and no major Indian manufacturing or services investment has yet been established on the ground in the Dominican Republic at scale. This represents both a gap and an opportunity: the Dominican Republic's investment promotion framework, including its free trade zone incentives and CAFTA-DR market access, is well suited to Indian companies in pharmaceuticals, textiles, agro-processing, and light engineering seeking a Caribbean or nearshoring base, sectors in which Indian companies have already demonstrated global competitiveness in other emerging markets. Conversely, Dominican investors have shown limited but growing interest in Indian markets, particularly in sectors linked to tourism-adjacent services and agro-commodities.

2.4 Bilateral Cooperation

Beyond trade and investment, India and the Dominican Republic have built a substantive cooperation agenda across several institutional tracks. India established an Information Technology Centre of Excellence in Santiago in 2011, which operated with Indian instructors to support local digital skills development. India has extended lines of credit, training slots under the Indian Technical and Economic Cooperation (ITEC) programme, and academic scholarships to Dominican nationals.

The two countries also cooperate within multilateral frameworks that reflect shared development priorities. The Dominican Republic is a member of the International Solar Alliance, the India-led initiative to expand solar energy deployment among member states, and has participated in the Coalition for Disaster Resilient Infrastructure (CDRI) since 2021, collaborating on the strengthening of early warning systems, the resilience of educational infrastructure, and the evaluation of critical infrastructure vulnerability, priorities directly relevant to a country exposed to hurricanes and other natural hazards. During the COVID-19 pandemic, the Government of India donated medicines and medical materials to support the Dominican Republic's public health response, an early demonstration of the pharmaceutical cooperation potential examined in greater detail in the sector chapters of this paper.

2.5 Areas for Future Cooperation

Building on this institutional foundation, several areas stand out as priorities for deepened cooperation over the coming years, each of which is examined in greater depth in the sector-specific chapters of this Knowledge Paper:

- Direct trade facilitation to reduce reliance on third-country intermediaries and formalise a larger share of existing indirect trade flows.
- Pharmaceutical and healthcare cooperation, leveraging India's position as a leading global supplier of generic medicines and vaccines against the Dominican Republic's growing healthcare infrastructure needs.
- Agricultural machinery and farm mechanisation, an area of direct relevance to the discussions between the Embassy of the Dominican Republic and CCI India.
- Renewable energy cooperation, connecting India's manufacturing capacity in solar equipment with the Dominican Republic's stated ambition to diversify its energy mix, reinforced by the country's membership of the International Solar Alliance.
- Institutional trade promotion mechanisms, including a more active operationalisation of JETCO and structured engagement between CCI India and Dominican chambers of commerce and free trade zone associations.
- Business delegation exchanges and B2B matchmaking events to build the direct commercial relationships needed to sustain trade growth beyond the current narrow product base.

Chapter 3: About the Embassy of the Dominican Republic in India

The Embassy of the Dominican Republic in India is the sole diplomatic representation of the Dominican Republic in the country, located in Vasant Vihar, New Delhi. The mission was formally opened on 1 May 2006, following an announcement made during a visit by an Indian Minister of State for External Affairs to the Dominican Republic in 2004 and a subsequent visit by the Dominican Republic's Minister of Foreign Affairs, Mr. Carlos Morales Troncoso, and an accompanying business delegation to Delhi, Agra, Bangalore, Hyderabad, and Mumbai in February 2006.

For close to two decades, the mission was led with distinction by the late Ambassador Hans Dannenberg Castellanos, who also served as Dean of the Diplomatic Corps in New Delhi, a role reflecting the standing the Dominican mission had built within India's diplomatic community.

The Embassy is currently headed by H.E. Francisco Compres H., Ambassador Extraordinary and Plenipotentiary of the Dominican Republic to India, supported by a commercial affairs team that includes a Counsellor for Commercial Affairs. Since assuming charge, Ambassador Compres H. has pursued an active agenda centred on trade promotion, investment facilitation, multilateral cooperation, renewable energy, climate resilience, and academic exchange, participating in a range of trade shows, investment forums, and diplomatic engagements across India, including the Uttar Pradesh International Trade Show, where he led a delegation of Dominican entrepreneurs and business leaders.

3.1 Mandate and Functions

As with any resident diplomatic mission, the Embassy of the Dominican Republic in India carries out political, commercial, and consular functions on behalf of the Government of the Dominican Republic. Its principal responsibilities include representing Dominican interests in bilateral and multilateral engagement with India, promoting Dominican trade, investment, and tourism to Indian audiences, providing consular services to Dominican nationals resident in or visiting India, and processing visa and documentation requirements for Indian nationals seeking to travel to the Dominican Republic. The Embassy also plays a central role in coordinating the participation of Dominican government agencies and business delegations in Indian trade fairs, investment summits, and industry events.

On the commercial side, the Embassy works closely with the Export and Investment Center of the Dominican Republic (ProDominicana) and the National Council of Export Free Zones (CNZFE) to channel Indian investor interest toward the appropriate Dominican institutions, and coordinates with Indian industry bodies, including chambers of commerce such as CCI India, to organise business matchmaking activities. This commercial mandate has become increasingly prominent in the Embassy's work programme in recent years, reflecting the priority both governments have placed on translating diplomatic ties into measurable trade and investment outcomes.

3.2 Recent Engagement with Indian Industry

The Embassy has intensified its outreach to Indian industry and state governments over the past two years, participating in trade shows hosted by Indian states and engaging directly with Indian chambers of commerce, including the meeting between H.E. Francisco Compres H. and Mr. Munindra Kumar, Director General of CCI India, that provided the impetus for this Knowledge Paper. This pattern of engagement reflects a broader Dominican strategy of building relationships with sub-national Indian markets and industry associations, rather than confining diplomatic effort to the national capital alone, recognising that much of India's manufacturing, pharmaceutical, and agricultural machinery capacity is concentrated in specific states and industrial clusters.

Chapter 4: Business Environment

4.1 Ease of Doing Business

The Dominican Republic has undertaken sustained reforms over the past decade to streamline business registration and cross-border trade procedures. Since 2014, the country has operated a single window for foreign trade (Ventanilla Unica de Comercio Exterior, VUCE), which consolidates the import and export authorisation services of multiple government agencies into a single electronic platform, reducing the time and cost associated with customs clearance. A separate single window for investment (Ventanilla Unica de Inversion, VUI-RD) assists investors in obtaining the permits, licenses, and certifications required to establish and operate a business across different sectors. Company incorporation is governed by the General Law on Companies (Law No. 479-08), which modernised corporate governance and introduced flexible corporate vehicles, including limited liability companies and simplified corporations, that are broadly familiar to Indian investors accustomed to comparable structures at home.

Notwithstanding these reforms, prospective investors should account for practical friction points common to the region, including variable processing timelines across different municipal and sectoral permitting authorities, the need for local legal and accounting counsel to navigate labour, tax, and environmental compliance requirements, and a labour law framework that provides strong statutory protections for employees, including mandatory severance payments, which should be factored into workforce planning from the outset.

4.2 Investment Climate

The Dominican Republic has positioned itself as one of the more investor-friendly jurisdictions in the Caribbean and Central American region, sustaining foreign direct investment inflows in excess of USD 4 billion annually in recent years, directed principally toward tourism, free trade zones, real estate, energy, and telecommunications. Foreign Investment Law No. 16-95 guarantees equal treatment between foreign and domestic investors, permits full foreign ownership in the large majority of sectors, allows unrestricted repatriation of profits and capital, and does not require foreign investors to incorporate a local entity in order to register an investment, branches of foreign companies may also register and repatriate profits under the law.

Investment registration with Pro-Dominicana, the Export and Investment Center of the Dominican Republic, is compulsory in principle, though not currently subject to sanction for non-compliance, and functions as a one-stop shop for investment information, registration, and after-care services, including a single-window registration process introduced in 2021 to streamline the process for foreign direct investment.

Political and macroeconomic stability, relative to several regional peers, is consistently cited by international investors and credit rating agencies as a favourable feature of the Dominican investment climate, alongside the country's consistent economic growth performance over the past two decades. Structural risks that investors should weigh include exposure to hurricanes and other natural hazards, a rising public debt trajectory, dependence on imported energy, and the cross-border implications of instability in neighbouring Haiti, each of which is examined further in the challenges chapter of this paper.

4.3 Legal Framework

The Dominican legal system is a civil law system rooted in the Napoleonic Code tradition, distinct from India's common law system, a difference that Indian companies should account for when structuring contracts, dispute resolution mechanisms, and corporate governance arrangements.

Key commercial legislation includes the General Law on Companies (Law No. 479-08), the Foreign Investment Law (Law No. 16-95), the Law on Trusts or Fideicomisos (Law No. 189-11), which enables sophisticated financing and asset-holding structures used in infrastructure and real estate development, and sector-specific legislation governing free trade zones, tourism, and public-private partnerships.

The Dominican Republic is a signatory to international arbitration conventions, and commercial contracts frequently incorporate international arbitration clauses, a practice Indian companies should adopt as standard when negotiating Dominican commercial agreements.

4.4 Taxation

The general corporate income tax rate in the Dominican Republic is 27 percent, applicable to companies operating outside preferential regimes such as free trade zones. The standard rate of the Tax on the Transfer of Industrialised Goods and Services (ITBIS), the Dominican value-added tax, is 18 percent, with a reduced rate of 16 percent applicable to certain services and exemptions for basic foodstuffs, medicines, educational materials, and a range of essential goods and services.

An excise tax (Impuesto Selectivo al Consumo, ISC) applies to specific categories including alcoholic beverages, tobacco products, and luxury goods. Companies operating within free trade zones benefit from substantially different tax treatment, examined in the following section.

4.5 Free Trade Zones

The Dominican Republic's free trade zone regime is among the most developed in the Caribbean and Central American region and represents one of the country's principal instruments for attracting export-oriented manufacturing and services investment. The regime is governed by Law No. 8-90 on the Promotion of Free Zones, administered by the National Council of Export Free Zones (CNZFE), a joint public-private body responsible for approving free zone operating licenses and overseeing compliance. Companies operating under free zone status benefit from full exemption from corporate income tax, ITBIS, asset and net worth tax, municipal taxes, and import duties on raw materials, machinery, equipment, construction materials, and other inputs required for production, for a renewable period of fifteen years in most parts of the country and twenty years for zones located near the Haitian border, an incentive designed to encourage investment in the country's less developed border provinces.

More than ninety free zone industrial parks currently operate across the country, hosting companies engaged in textiles and apparel, medical devices, pharmaceuticals, business process outsourcing and services, electronics assembly, tobacco products, and light manufacturing, and collectively generating export revenues in excess of USD 8 billion in 2024.

To establish operations within a free zone, a company must submit a formal application to the CNZFE, which assesses the project's feasibility, employment generation, and export orientation before granting an operating license. For Indian companies in pharmaceuticals, textiles, medical devices, and light engineering, the free zone regime offers a particularly compelling combination of tax efficiency, proximity to the United States market under CAFTA-DR preferences, and access to a trained, English-conversant workforce.

4.6 Investment Incentives

The Dominican Republic also offers sector-specific incentives, notably Law No. 158-01 for tourism, which grants qualifying hotel and resort projects full exemption from income tax and related national and municipal taxes, relevant for Indian investors in hospitality.

Public-private partnership legislation enables long-term concession contracts of up to forty years for infrastructure projects, accompanied by value-added tax exemptions and accelerated depreciation allowances, administered by the General Directorate of Public-Private Partnerships (DGAPP). A border development incentive regime under Law No. 12-21 extends free-zone-equivalent benefits to companies establishing operations in the provinces bordering Haiti, supporting the government's economic development priorities for that region.

4.7 Logistics

The Dominican Republic's logistics infrastructure is anchored by the Multimodal Caucedo port, one of the leading transshipment hubs in the Caribbean and Central American region, complemented by the Port of Haina and additional facilities serving containerised cargo, bulk commodities, and cruise tourism.

This maritime infrastructure, combined with the country's international airport network, led by Las Americas International Airport near Santo Domingo and Punta Cana International Airport, provides multiple viable entry points for Indian exporters, whether shipping containerised cargo through Caucedo or air freight through Las Americas.

The absence of a direct shipping line between India and the Dominican Republic remains a practical constraint, with most current India-Dominican Republic cargo routed through transshipment hubs in the Middle East, Europe, or the United States, a factor that contributes to the elevated logistics costs and third-country intermediation discussed in Chapter 2 of this paper.

4.8 Financial System

The Dominican financial system is regulated by the Central Bank of the Dominican Republic (Banco Central de la Republica Dominicana, BCRD) and the Superintendency of Banks, and comprises a mix of multiple banking, savings and loan, and specialised financial institutions. The sector is dominated by a small number of large, well-capitalised multiple banks that offer a full range of commercial banking, trade finance, and foreign exchange services, and the country operates a free foreign exchange market that facilitates the repatriation of profits and capital by foreign investors, including those operating in free trade zones. Access to local commercial credit for new market entrants can be more constrained and costlier than in India, a factor that Indian companies typically address in the initial years of Dominican operations through parent-company financing, trade credit facilities extended by Indian banks with correspondent relationships in the region, or financing through export credit agencies.

Chapter 5: Economic Overview

5.1 Structure of the Economy

The Dominican economy rests on four principal pillars. Tourism is the largest single contributor to foreign exchange earnings, with the country receiving in excess of ten million visitors annually in recent years, drawn primarily to the Punta Cana, Puerto Plata, and Samana coastal resort areas, and supporting a substantial ecosystem of hospitality, transport, food and beverage, and retail services. Free trade zone manufacturing and services, built on more than three decades of export-oriented industrial policy under Law No. 8-90, contribute significantly to exports and formal employment, particularly in textiles, medical devices, and business process services.

Mining, led by ferronickel and gold production, has grown in importance as a source of export revenue and fiscal contribution, supported by continued investment in extraction capacity.

Remittances, principally from the Dominican diaspora in the United States, provide a further significant and comparatively stable source of foreign exchange, supporting household consumption and, indirectly, the construction and retail sectors.

Agriculture, while a smaller share of GDP than in previous decades, remains an important source of rural employment and food security. Services, including tourism, financial services, telecommunications, and free trade zone operations, account for the majority of GDP, industry, including mining, manufacturing, and construction, forms a substantial secondary pillar, and agriculture, while smaller in relative terms, continues to underpin rural livelihoods and food security.

5.2 Growth Trajectory

The Dominican Republic has been one of the fastest-growing economies in Latin America and the Caribbean over the past two decades, averaging annual GDP growth in excess of 5 percent between 2010 and 2019. The economy contracted sharply during the COVID-19 pandemic, by approximately 6.7 percent in 2020, before rebounding strongly with growth exceeding 12 percent in 2021 as tourism recovered and pent-up domestic demand was released. Growth moderated in subsequent years, registering approximately 2.1 percent in 2025. The World Bank projects a reacceleration to approximately 3.6 percent in 2026 and 4.4 percent in 2027, driven by a rebound in private investment and construction activity, resilient private consumption supported by remittance inflows, and sustained export performance in tourism and gold mining.

Inflation has generally remained within or close to the Central Bank's target range of 4 percent plus or minus 1 percentage point, averaging approximately 3.9 percent over the decade to 2024, though subject to periodic external shocks, including a spike in food prices following Hurricane Melissa that pushed December inflation to approximately 4.9 percent. The Central Bank has used monetary policy actively to manage these fluctuations, including targeted liquidity programmes to support demand and credit during periods of tighter financial conditions.

5.3 Fiscal and External Position

Public finances have come under increasing pressure in recent years, with the fiscal deficit reaching approximately 3.6 percent of GDP in 2025 and public debt rising to approximately 58 percent of GDP, reflecting both slower growth and elevated interest payments on outstanding debt.

The Dominican government has pursued efforts to strengthen revenue administration, including expanded electronic invoicing requirements, though a proposed comprehensive tax reform introduced in late 2024 was withdrawn following public opposition, underscoring the political sensitivity of fiscal consolidation measures in the current environment.

Government revenues have remained broadly stable at approximately 15 to 16 percent of GDP, a level that international financial institutions have identified as comparatively low by regional standards and a constraint on the government's capacity to expand public investment and social spending.

On the external side, the current account deficit has generally remained manageable and substantially covered by foreign direct investment inflows, a favourable configuration that has supported relative exchange rate stability. Foreign exchange reserves have been maintained at healthy levels, providing a buffer against external shocks, and the peso has depreciated only gradually against the US dollar over the past decade, a pattern of relative currency stability that Indian exporters and investors should factor favourably into their commercial planning relative to more volatile regional currencies.

5.4 Outlook and Implications for Indian Industry

The overall macroeconomic outlook for the Dominican Republic remains constructive, with growth expected to reaccelerate through 2026 and 2027 following a period of moderation, underpinned by continued strength in tourism, mining, and free trade zone exports, and supported by a stable currency and manageable, if rising, public debt.

For Indian industry, this trajectory suggests a market that will continue to expand its import demand for pharmaceuticals, healthcare products, industrial and agricultural machinery, and consumer goods over the medium term, while fiscal constraints on the Dominican government point toward continued reliance on private investment, including foreign direct investment, to finance infrastructure and industrial expansion, an opening for Indian companies with capital and technical expertise to deploy.

Chapter 6: Trade Analysis

6.1 Overview of Dominican Trade

The Dominican Republic runs a persistent merchandise trade deficit, with total exports of approximately USD 11 to 14 billion and total imports of approximately USD 20 to 27 billion in recent years, a gap financed principally by tourism receipts, remittances, and foreign direct investment inflows rather than by goods trade alone. Principal export categories include gold and other minerals, cigars and tobacco products, medical instruments and devices, cocoa, sugar, coffee, bananas, and apparel produced within the free trade zone regime. Principal import categories include petroleum and refined fuels, foodstuffs, machinery and vehicles, electronics, and chemicals and pharmaceuticals, reflecting the country's continued dependence on imported energy and its position as a net importer of manufactured capital goods.

The United States is by a substantial margin the Dominican Republic's largest trading partner, accounting for approximately half of exports and over 40 percent of imports, a relationship anchored by CAFTA-DR preferential access and the free trade zone regime's orientation toward the North American market. Other significant trading partners include Haiti, a major destination for Dominican exports given the extensive land border and informal trade linkages, China, a growing source of imports, and European partners including Switzerland and Spain. India appears among the Dominican Republic's export destinations, reflecting Dominican shipments of gold and other commodities to the Indian market, though India's position among Dominican import sources remains comparatively modest relative to its manufacturing scale, underscoring the market share opportunity available to Indian exporters.

6.2 India-Dominican Republic Trade

As set out in Chapter 2, bilateral trade between India and the Dominican Republic has grown from approximately USD 431.57 million in 2014-15 to a record level of over USD 1.1 billion in 2024, a trajectory that reflects steady, if uneven, growth across the past decade. India's exports to the Dominican Republic are led by pharmaceuticals and generic medicines, an area where Indian suppliers are globally competitive on cost and quality, vehicles and automotive components, textiles and ready-made garments, organic and inorganic chemicals, and engineering goods, including machinery and mechanical appliances.

Dominican exports to India are considerably more concentrated, dominated by gold, which typically accounts for the majority of Dominican shipments to India by value, alongside iron and steel products, medical instruments, tobacco, and cocoa derivatives.

This trade structure reveals both a strength and a vulnerability. The strength lies in genuine sectoral complementarity: India's pharmaceutical, textile, and engineering export capacity aligns closely with the import needs of a growing Dominican consumer and industrial base, while Dominican gold and agro-commodity exports meet steady Indian demand

The vulnerability lies in concentration, a large share of the relationship's value rests on a narrow set of product categories on each side, and the trade relationship remains exposed to the third-country intermediation distortion identified by Indian diplomatic officials, whereby a significant share of Indian goods reach the Dominican market indirectly rather than through direct, officially recorded bilateral trade channels.

6.3 Future Opportunities

Several concrete opportunities exist to both formalise and diversify India-Dominican Republic trade over the coming years. Formalising indirect trade flows, by encouraging Indian exporters and Dominican importers to establish direct commercial relationships and shipping arrangements rather than routing through third countries, would immediately and measurably increase recorded bilateral trade without requiring any new product development.

Diversifying Indian exports into currently underpenetrated categories, including agricultural machinery, medical devices, renewable energy equipment, and processed food products, would reduce the relationship's dependence on its current core categories and align with specific sectors of Dominican government priority, examined in the sector chapters that follow. Increasing Indian imports of Dominican cocoa, cigars, and specialty agricultural products, beyond the current gold-dominated import profile, would provide Dominican exporters with a larger and more diversified Indian customer base and support a more balanced, sustainable trade relationship.

The operationalisation of the Joint Economic and Trade Committee (JETCO), established in March 2024, provides the institutional mechanism through which many of these opportunities can be pursued in a structured, government-supported manner, provided that industry bodies on both sides, including CCI India, actively engage with the Committee's agenda rather than leaving its implementation solely to government officials.

Chapter 7: Priority Sectors for India-Dominican Republic Cooperation

7.1 Agriculture

Overview

Agriculture remains a foundational sector of the Dominican economy, contributing approximately 5.5 to 5.6 percent of GDP directly, a share that understates its broader importance to rural employment, food security, and export earnings when related agro-processing and logistics activity is included. The sector employs close to 15 percent of the national labour force across approximately 319,676 agricultural production units and 259,971 registered agricultural producers, the large majority of them smallholders engaged in crop production, with a smaller share dedicated to livestock.

Current Market Situation

Rice is the country's principal staple crop, and the Dominican Republic maintains near self-sufficiency in rice production, supported by government price and import management programmes, including the Pledge Program (Programa de Pignoracion), though productivity growth in rice has lagged behind that of the broader agricultural sector. The country has achieved notable recent success in horticulture and fruit production, with substantial expansion in greenhouse cultivation and rising output of avocado, mango, tomato, and flowers, alongside a large and growing egg and poultry sector that now produces approximately 430 million eggs per month, a portion of which is exported to neighbouring Caribbean markets including Cuba.

Sugarcane remains an important commercial crop, cultivated principally in the southeastern provinces, though production has declined substantially from its historical peak as land has shifted toward more diversified food and export crops. Cocoa and coffee, examined separately in this paper given their distinct strategic importance, are significant export-oriented tree crops grown principally in the Cibao and southwestern regions.

Growth Drivers

Growth in the sector is being driven by continued technification and productivity investment, particularly in greenhouse horticulture and fruit production, which has measurably increased farmer incomes and export volumes in recent years. Rising domestic demand linked to tourism, which creates a large and growing institutional and hospitality market for fresh produce, poultry, and dairy, provides a further structural driver, as does continued government investment in irrigation infrastructure and extension services aimed at closing productivity gaps relative to regional and global benchmarks.

Challenges

The sector faces several structural constraints. Productivity in staple grain production, particularly rice, continues to lag regional benchmarks despite decades of government support programmes. Reliance on imported animal feed inputs, particularly soybean meal, for the poultry, swine, and dairy sectors exposes the sector to global commodity price volatility. Labour availability has become an increasingly prominent constraint, prompting the government's current push toward mechanization discussed in the following section, and the sector remains exposed to hurricane and other climate-related production shocks, illustrated by the flooding and crop damage associated with Hurricane Melissa. Smallholder access to affordable credit and modern machinery remains limited relative to the capital requirements of a more mechanized, export-oriented agricultural model.

Government Support and Policy Framework

The Dominican Ministry of Agriculture has intensified its policy focus on productivity and mechanization, including the National Mechanization Program (Programec), scheduled to launch in mid-2026 with the explicit objectives of modernising Dominican fields into more efficient, technology-driven production zones, lowering production costs, and reducing the sector's reliance on scarce agricultural labour.

The government has also continued to manage rice import policy actively, including new quota restrictions introduced in December 2024 under Decree 693-24 to protect domestic rice producers even as CAFTA-DR tariff schedules for rice move toward full liberalisation. Soybean meal, a critical feed input, continues to benefit from import tax exemption given its role in supporting the poultry, swine, and dairy sub-sectors.

Investment Opportunities

Investment opportunities exist across the value chain, including greenhouse and controlled-environment agriculture technology, irrigation systems and precision agriculture solutions, cold chain and post-harvest handling infrastructure to reduce the substantial post-harvest losses common in tropical fruit and vegetable production, and animal feed processing capacity that could reduce the sector's reliance on imported soybean meal. The government's forthcoming Programme mechanization initiative is likely to generate specific procurement and partnership opportunities for machinery suppliers, examined in detail in the following chapter.

Opportunities for Indian Companies

Indian companies have globally competitive offerings directly relevant to Dominican agricultural priorities, including drip and micro-irrigation systems, in which Indian manufacturers are among the world's largest producers, greenhouse and polyhouse technology suited to smallholder and mid-scale horticulture operations, and agro-processing and cold storage equipment.

Indian expertise in extension-style farmer training models, developed through decades of engagement with India's own smallholder-dominated agricultural sector, is also directly transferable to the Dominican context and could be packaged as a technical cooperation offering alongside equipment sales.

Role of CCI India

CCI India can organise a dedicated agri-technology trade mission to the Dominican Republic timed to coincide with the launch of the National Mechanization Program (Programme) in 2026, introducing Indian irrigation, greenhouse, and post-harvest technology suppliers directly to the Ministry of Agriculture and prospective private-sector buyers at the moment of maximum government receptivity.

CCI India can facilitate a technical cooperation partnership between Indian agricultural universities or extension bodies and the Dominican Ministry of Agriculture, focused on smallholder productivity and post-harvest loss reduction, building institutional relationships that extend beyond one-off equipment sales into sustained knowledge partnership.

Strategic Recommendations

- Prioritise Indian irrigation and greenhouse technology companies for early engagement with Dominican horticulture producers, given the sector's demonstrated recent growth and receptiveness to productivity-enhancing technology.
- Support the development of a soybean and animal feed processing joint venture proposal pairing Indian agro-processing expertise with Dominican feed demand, reducing import dependence for both partners over time.
- Position CCI India as a coordinating partner for Indian participation in the Programme mechanization initiative from its earliest planning stages rather than after tenders are issued.

7.2 Farm Equipment and Agricultural Machinery

Overview

Farm equipment and agricultural machinery represent one of the most direct and immediate opportunities identified in the discussions between the Embassy of the Dominican Republic and CCI India. India has developed one of the world's largest and most cost-competitive agricultural machinery manufacturing sectors, led by tractor manufacturers with substantial export experience across Africa, Latin America, and Southeast Asia, and this manufacturing base is well matched to the Dominican Republic's stated policy priority of accelerating farm mechanization.

Current Market Situation

The Dominican Republic's agricultural machinery stock has historically lagged that of larger Latin American markets, with a substantial share of existing tractors and implements ageing and imported second-hand rather than new. Chinese manufacturers, including Zoomlion, have made recent inroads into the Dominican market, including government-linked donations of sugarcane harvesters and rice-sector machinery, establishing an early-mover position that Indian manufacturers do not yet match in the Dominican market despite India's comparable or superior cost competitiveness in several equipment categories, including compact tractors, power tillers, and threshers.

Growth Drivers

The principal near-term driver is the Dominican government's National Mechanization Program (Programme), scheduled for launch in mid-2026, which is explicitly designed to transition Dominican farms toward more efficient, technology-driven operations and to reduce dependence on increasingly scarce agricultural labour. Rising rural wage costs and continued labour migration away from agriculture reinforce the underlying economic case for mechanization, as does the government's broader productivity agenda across rice, horticulture, and livestock feed production.

Challenges

Smallholder farmers, who make up the large majority of Dominican agricultural producers, face significant financing constraints in acquiring new machinery, making financing structures as important as product competitiveness in determining market success. After-sales service and spare parts availability are critical differentiators in a market where farmers cannot afford extended equipment downtime during planting or harvest windows, and the absence of an established Indian equipment dealer or service network in the Dominican Republic is a material barrier to entry that Chinese competitors have moved more quickly to address.

Government Support and Policy Framework

The forthcoming Programec initiative is expected to include financing, subsidy, or leasing mechanisms to improve smallholder access to modern machinery, details of which will become clearer as the programme launches in 2026. Soybean meal and certain agricultural inputs already benefit from tax exemptions, and equipment imported under free trade zone or agricultural incentive regimes may qualify for reduced duties, though the precise treatment of imported farm machinery under general trade rules should be confirmed with Dominican customs authorities on a product-by-product basis.

Investment Opportunities

Opportunities exist for Indian manufacturers to establish a Dominican or wider Caribbean distribution and service base, potentially leveraging the free trade zone regime for a regional parts and assembly operation serving not only the Dominican Republic but neighbouring Caribbean and Central American markets.

Joint venture or dealership partnerships with established Dominican agricultural equipment distributors would allow Indian manufacturers to enter with lower upfront capital commitment while building local service capacity.

Opportunities for Indian Companies

Indian tractor manufacturers, several of which rank among the largest by volume globally, are well positioned to compete for the compact and mid-horsepower tractor segment most relevant to Dominican farm sizes, an area where Chinese suppliers have gained an early foothold but where Indian manufacturers offer comparable pricing with generally stronger parts standardisation and a longer track record of tropical and smallholder-market durability. Indian manufacturers of power tillers, threshers, sprayers, and small-scale irrigation pumps also offer strong fit for Dominican horticulture and rice producers specifically.

Role of CCI India

CCI India can coordinate a structured market entry programme for Indian farm equipment manufacturers, including participation in Dominican agricultural trade fairs, direct introductions to the Ministry of Agriculture in the context of the Programme launch, and support in identifying credible local distribution partners, addressing the after-sales service gap that currently disadvantages Indian suppliers relative to Chinese competitors.

CCI India can explore, together with Indian financial institutions and export credit agencies, the development of a farmer-financing or leasing facility to accompany Indian equipment sales into the Dominican market, directly addressing the smallholder financing constraint identified as a principal barrier to mechanization uptake.

Strategic Recommendations

- Treat the 2026 Programec launch as a defined market entry window and ensure Indian manufacturer participation in the programme's design and procurement consultations rather than engaging only after implementation begins.
- Prioritise establishment of a regional parts and service hub, potentially within a Dominican free trade zone, to close the after-sales service gap relative to Chinese competitors.
- Package equipment offers together with financing or leasing solutions specifically designed for smallholder affordability constraints.

7.3 Pharmaceuticals

Overview

Pharmaceuticals represent one of the most immediately actionable sectors for India-Dominican Republic cooperation, reflecting India's position as the world's leading supplier of generic medicines and the Dominican Republic's status as a price sensitive, largely generic pharmaceutical market with an established local manufacturing base.

Current Market Situation

Domestic pharmaceutical manufacturers currently supply a substantial share of the Dominican formulated generic medicines market and additionally export to other markets in Central America and the Caribbean, while India already supplies a meaningful share of the country's imported generic medicines. According to United Nations Comtrade data, India's exports of pharmaceutical products to the Dominican Republic reached approximately USD 70 to 75 million in 2024, spanning finished medicaments, vaccines and blood products, and active pharmaceutical ingredients, though industry estimates of the value and market share of Indian generics vary and should be treated as approximate.

Growth Drivers

Demand growth is being driven by the continued expansion of SENASA and public benefits package coverage described in the preceding section, a growing private market for branded generics and specialty therapies including biologics, and the underlying demographic trend toward an older population with higher per capita medicine consumption.

Challenges

Market entry for new generic suppliers, including Indian manufacturers, is constrained by sanitary registration timelines at the Directorate General of Medicines, Food and Health Products (DIGEMAPS), which have historically required approximately six to seven months for standard applications, notwithstanding a simplified track of approximately four months available for a defined list of product categories since 2015.

The market is also price sensitive and served by an established base of local manufacturers and international competitors, and distribution is concentrated among a limited number of large wholesalers and pharmacy chains, requiring new entrants to secure credible local partners.

Government Support and Policy Framework

DIGEMAPS, reorganised as a decentralised, autonomous entity under Decree No. 231-23, continues to modernise its sanitary registration and homologation processes, including efforts to recognise registrations already granted by stringent regulatory authorities in the United States and the European Union, a development that could materially shorten market entry timelines for Indian manufacturers holding equivalent international certifications.

Public procurement of essential medicines through SENASA and government tenders provides an additional, price competitive channel for Indian generic suppliers.

Investment Opportunities

Investment opportunities include local distribution and registration partnerships with established Dominican pharmaceutical wholesalers, participation in essential medicine public tenders, and, over the medium term, exploration of contract manufacturing or formulation partnerships that could leverage the Dominican Republic's free trade zone regime for re-export to the wider CAFTA-DR and CARICOM markets.

Opportunities for Indian Companies

Indian pharmaceutical companies, many holding World Health Organization Good Manufacturing Practice, United States Food and Drug Administration, and European Medicines Agency certifications, are well positioned to compete on both price and quality in the Dominican generic market, particularly as DIGEMAPS moves toward recognising equivalent international registrations.

Opportunities extend across finished generic formulations, active pharmaceutical ingredients for local formulators, and vaccines and biologics for public health programmes.

Role of CCI India

CCI India can support Indian pharmaceutical companies in identifying credible Dominican distribution partners and navigating the DIGEMAPS sanitary registration process, including monitoring the pace of regulatory homologation reforms relevant to Indian certified products.

CCI India can organise a dedicated pharmaceutical sector business delegation timed to engage both DIGEMAPS and leading Dominican distributors, and can support Indian companies in identifying opportunities within SENASA and government essential medicine tenders.

Strategic Recommendations

- Monitor DIGEMAPS regulatory homologation reforms closely and prioritise Indian manufacturers holding WHO-GMP, US FDA, or EMA certification for early market entry as recognition arrangements develop.
- Facilitate distribution partnership discussions between Indian generic manufacturers and established Dominican pharmaceutical wholesalers ahead of broader market entry.
- Support Indian active pharmaceutical ingredient and vaccine manufacturers in engaging with SENASA and public essential medicine tender processes.

7.4 Automobile Sector

Overview

The automobile sector represents an area of already demonstrated commercial success in the India-Dominican Republic trade relationship, and offers a foundation from which CCI India can help build a more structured and diversified partnership beyond spot import transactions.

Current Market Situation

The Dominican Republic's vehicle supply is entirely import dependent, with no domestic passenger vehicle assembly or manufacturing base, sustaining consistent demand for imported new and used vehicles across a fragmented dealership and used vehicle market. New light vehicle sales totalled approximately 38,000 units in 2025, a contraction of approximately 14 percent from the prior year, within a market concentrated among a small number of Asian brands, with Toyota, Honda, and Hyundai together accounting for more than half of new vehicle sales.

India already figures as a meaningful supplier to this market: Indian vehicle exports, comprising substantially motorcycles and smaller commercial and passenger categories, reached approximately USD 68 to 87 million in 2024 according to differing United Nations Comtrade based estimates, making vehicles the second largest category of Indian exports to the Dominican Republic after pharmaceutical products.

Growth Drivers

Growth drivers include an expanding middle class with increasing purchasing power for private vehicle ownership, continued strength in tourism-linked commercial fleet and rental vehicle demand, and a nascent but government supported shift toward electric mobility, with approximately 17,500 electric vehicles registered in the country by the end of 2023 under the National Strategic Plan for Electric Mobility.

Challenges

The market's near total reliance on imports exposes it to significant tariff and tax costs, including a 20 percent import duty, an 18 percent tax on transfer of industrialised goods and services (ITBIS), a 3 percent processing fee, and a selective consumption tax on vehicles ranging from approximately 15 to 60 percent of CIF value, though most United States sourced vehicles receive preferential treatment under CAFTA-DR. Brand loyalty toward long established Japanese and Korean marques, combined with concerns among some buyers about after sales parts availability for newer entrant brands, represents an additional barrier for Indian passenger vehicle manufacturers seeking to expand beyond the two-wheeler and commercial vehicle segments where they are already present.

Government Support and Policy Framework

The National Strategic Plan for Electric Mobility provides tax incentives for electric and hybrid vehicle imports, though high acquisition costs continue to constrain adoption even after incentives. CAFTA-DR tariff treatment continues to favour United States sourced vehicles over third country imports, a factor Indian exporters should account for in pricing and market positioning.

Investment Opportunities

Opportunities exist for Indian two-wheeler, three-wheeler, and light commercial vehicle manufacturers to expand distribution and after sales service networks beyond their current base, for electric two-wheeler manufacturers to serve the growing electric mobility segment as a more affordable entry point than passenger electric vehicles, and for Indian component and accessory suppliers to support the country's fragmented but active vehicle aftermarket.

Opportunities for Indian Companies

Indian two-wheeler and three-wheeler manufacturers, already present in the Dominican import market, are well positioned to expand market share given their cost competitiveness and suitability for the country's urban and semi-urban transport patterns, while Indian electric two-wheeler manufacturers could capture an early position in a market where affordable electric options remain limited. Indian passenger and light commercial vehicle manufacturers with established Latin American and Caribbean distribution experience could explore entry through Dominican dealership partnerships.

Role of CCI India

CCI India can support Indian two-wheeler, three-wheeler, and commercial vehicle manufacturers already exporting to the Dominican Republic in identifying and formalising dealership and after sales service partnerships to convert existing spot trade into sustained market presence.

CCI India can also facilitate introductions between Indian electric vehicle manufacturers and Dominican authorities responsible for the National Strategic Plan for Electric Mobility, positioning affordable Indian electric two-wheelers as a complement to the government's mobility transition goals.

Strategic Recommendations

- Support Indian two-wheeler and commercial vehicle exporters in converting existing spot trade into formal Dominican dealership and after sales service networks.
- Position Indian electric two-wheeler manufacturers as an affordable entry point aligned with the National Strategic Plan for Electric Mobility.

- Advise Indian vehicle exporters on CAFTA-DR competitive dynamics and the full landed cost structure, including the selective consumption tax, when pricing for the Dominican market.

7.5 Manufacturing

Overview

Manufacturing, anchored substantially by the country's free trade zone regime, is a structural pillar of the Dominican economy and the primary channel through which Indian companies could pursue direct investment and production partnerships rather than trade alone.

The sector also offers opportunities for Indian manufacturers to leverage the Dominican Republic as a strategic production and export hub for accessing markets across the Caribbean, Central America, and the Americas under preferential trade arrangements.

Current Market Situation

Industry, including manufacturing, mining, and construction, accounts for approximately one third of Dominican GDP, and free trade zone based manufacturing alone generated exports exceeding USD 8.6 billion in 2024, equivalent to more than 60 percent of the country's total exports and growing by approximately 8 percent year on year. More than 820 companies currently operate across approximately 87 to 92 industrial free zones, spanning textiles and apparel, medical devices, electronics, pharmaceuticals, tobacco processing, and agro-industrial goods, and providing close to 200,000 direct jobs nationally.

Growth Drivers

Growth is being driven by the global nearshoring trend favouring manufacturing locations with proximity and preferential trade access to the United States, continued government investment in free trade zone infrastructure and new industrial park approvals, and diversification of the free trade zone base beyond its traditional textile and apparel origins into higher value medical device, electronics, and pharmaceutical manufacturing, as discussed in the preceding sections.

Challenges

The manufacturing base remains concentrated in assembly, finishing, and contract manufacturing activity rather than higher value design, product development, or capital goods production, and continues to depend heavily on imported machinery, equipment, and intermediate inputs. Rising global competition for nearshoring investment from other Latin American and Caribbean jurisdictions, together with domestic energy costs, represent ongoing competitiveness considerations for manufacturers based in the country.

Government Support and Policy Framework

The free trade zone regime under Law No. 8-90, administered through the National Council of Free Zones for Export (CNZFE) and supported by the National Council for Industrial Competitiveness (ProIndustria) outside the zone system, provides the core policy framework for manufacturing investment, offering comprehensive tax, customs, and duty exemptions to export oriented operations. The Council continues to approve new industrial parks and ventures on a rolling basis, reflecting sustained government prioritisation of manufacturing investment attraction.

Investment Opportunities

Investment opportunities include component and intermediate goods manufacturing to supply the free trade zone system's existing textile, medical device, and electronics manufacturers, direct establishment of Indian manufacturing operations within free trade zones to serve the CAFTA-DR export market, and capital goods and machinery supply to the country's expanding industrial base.

Opportunities for Indian Companies

Indian manufacturers across light engineering, textiles, plastics, and electronics sub-assembly have relevant capabilities to participate either as direct free trade zone investors or as suppliers of intermediate goods and machinery to manufacturers already established in the country, benefiting from CAFTA-DR access to the United States market that direct exports from India cannot obtain.

Role of CCI India

CCI India can develop and disseminate a structured briefing for Indian manufacturers on the mechanics, incentives, and application process of the Dominican free trade zone regime.

CCI India can position Indian machinery and capital goods manufacturers as suppliers to the country's expanding free zone manufacturing base, and can facilitate a manufacturing focused business delegation engaging the National Council of Free Zones for Export, ProIndustria, and the Dominican Association of Free Zones (Adozona)

Strategic Recommendations

- Develop a structured briefing and advisory service for Indian manufacturers evaluating a Dominican free trade zone investment, covering incentives, application procedures, and sector fit.
- Position Indian capital goods and machinery manufacturers as suppliers to the free trade zone system's textile, medical device, and electronics manufacturers.

7.6 Textiles

Overview

Textiles and apparel manufacturing has historically been the founding sector of the Dominican Republic's free trade zone regime, and while it has been overtaken in export value by medical devices, it remains a substantial employer and a sector where India, as one of the world's largest textile and yarn producers, has a structurally distinct role to play as an input supplier rather than a finished goods competitor.

Current Market Situation

Apparel remains a leading free trade zone export category, with garments such as t-shirts and knitwear together accounting for a meaningful share of national exports, and long-established global brands including Hanesbrands, Fruit of the Loom, Champion, Gap, Old Navy, and VF Corporation continuing to manufacture in Dominican free zones. The sector's competitiveness rests substantially on CAFTA-DR preferential access to the United States market, which is governed by a yarn-forward rule of origin requiring apparel to be cut and sewn from yarn and fabric produced within the United States or the CAFTA-DR region for goods to qualify for duty free treatment.

Growth Drivers

Growth drivers include continued brand loyalty to CAFTA-DR sourcing given its proximity to the United States market and shorter lead times than Asian sourcing, ongoing investment by established apparel manufacturers in modernising Dominican production capacity, and diversification into higher value categories such as technical and performance apparel.

Challenges

The yarn-forward rule of origin is the central structural constraint facing any Indian ambition to directly supply fabric or yarn into Dominican apparel exports bound for the United States, since Indian origin textile inputs do not generally qualify for CAFTA-DR preferential treatment unless the specific fibre, yarn, or fabric appears on the CAFTA-DR short supply list, which identifies inputs determined not to be available in commercial quantities within the region and may accordingly be sourced from outside CAFTA-DR countries.

Government Support and Policy Framework

Free trade zone incentives under Law No. 8-90 apply fully to textile and apparel manufacturing, and the Dominican government continues to support the sector through the National Council of Free Zones for Export. The CAFTA-DR short supply list process periodically adds specific fibres, yarns, and fabrics determined to be in short regional supply, offering a narrow but real channel through which specific Indian textile inputs could enter qualifying Dominican apparel production.

Investment Opportunities

Investment opportunities include supply of specialty fibres, yarns, or fabrics that already appear, or could be petitioned to be added to, the CAFTA-DR short supply list, direct investment or joint ventures in Dominican apparel manufacturing capacity to access CAFTA-DR preferential treatment domestically rather than through direct export from India, and supply of apparel manufacturing machinery and technical inputs not subject to rule of origin constraints.

Opportunities for Indian Companies

Indian textile companies are better positioned to participate in the Dominican apparel export model as domestic manufacturing investors or joint venture partners, thereby directly benefiting from CAFTA-DR access, than as direct exporters of fabric or yarn from India, given the yarn-forward rule of origin. Indian companies with specialty fibre or technical textile capabilities not otherwise available in the CAFTA-DR region have a more direct route to market through the short supply list process.

Role of CCI India

CCI India can commission a detailed technical briefing on the CAFTA-DR yarn-forward rule and short supply list process for Indian textile companies considering the Dominican market, distinguishing between the limited direct export opportunity and the more substantial opportunity for manufacturing investment or joint ventures within Dominican free zones.

CCI India can also facilitate introductions between Indian textile machinery manufacturers and Dominican apparel producers modernising their production capacity.

Strategic Recommendations

- Commission a CAFTA-DR rules of origin briefing to clarify for Indian textile companies which categories of fibre, yarn, or fabric could realistically access the Dominican market, whether through the short supply list or through domestic manufacturing investment.
- Explore joint venture or manufacturing investment models for Indian apparel companies seeking direct CAFTA-DR market access, rather than prioritising direct fabric or yarn exports from India.

7.7 Tourism

Overview

Tourism is the single largest pillar of the Dominican economy and the country's principal source of foreign exchange. The sector rests on a mature all-inclusive resort model concentrated in Punta Cana and Bavaro, complemented by a diversifying portfolio of destinations including the colonial heritage core of Santo Domingo, a UNESCO World Heritage Site, the north coast around Puerto Plata and Samana, and emerging eco luxury frontiers such as Miches and the Pedernales peninsula in the southwest. The Dominican Republic has consolidated its position as the most visited destination in the Caribbean and ranks among the leading tourism economies in the wider Americas.

Current Market Situation

The Dominican Republic recorded approximately 11.6 million international visitor arrivals in 2025, a historic annual high driven by strong air connectivity and a sustained recovery in cruise tourism, which alone accounted for approximately 2.8 million passengers during the year. Tourism receipts reached approximately USD 10.5 billion in 2024 and were projected to exceed USD 11 billion in 2025. The United States remains the dominant source market, accounting for approximately half of international arrivals, followed by Canada and a growing base of visitors from Latin America and Europe.

The country's hotel inventory stood at approximately 92,000 rooms as of late 2025, with average occupancy exceeding 80 percent in leading destinations such as Punta Cana and La Romana. Tourism directly and indirectly contributes an estimated 15 percent of gross domestic product and is the largest source of formal employment outside agriculture.

Growth Drivers

- Continued expansion of international air connectivity, including new routes from North America, Europe and Latin America.
- Geographic diversification of the tourism offers beyond Punta Cana into Miches, Puerto Plata, Samana and the developing Pedernales and Bahia de las Aguilas poles.
- Sustained public and private investment in hotel capacity, cruise port infrastructure and destination marketing led by the Ministry of Tourism.
- Rising demand for wellness, eco-tourism and experiential travel segments that complement the traditional all-inclusive model.

Challenges

- High dependence on the United States as a single source market, which creates exposure to shifts in North American travel demand and air connectivity.

- Environmental pressure on coastal ecosystems, water resources and solid waste systems in high density resort areas.
- Persistent skill gaps in hospitality management, culinary services and multilingual guest services as the sector scales.
- Need to extend the economic benefits of tourism growth to smaller and emerging destinations beyond the established resort corridor.

Government Support and Policy Framework

The Ministry of Tourism (MITUR) leads sector policy and international promotion, working closely with the Asociacion de Hoteles y Turismo de la Republica Dominicana (ASONAHORES), the principal private sector body representing hotel and tourism operators. Law 158-01 on the Promotion of Tourism Development, administered through the Council for the Promotion of Tourist Investment (CONFOTUR), provides tax exemptions on income tax, import duties and property transfer taxes for qualifying hotel, eco tourism and tourism infrastructure projects located in designated development poles, including newer zones such as Pedernales that the government is actively promoting to broaden the geographic base of the industry.

Investment Opportunities

- Hotel and resort development in emerging tourism poles such as Miches, Puerto Plata and Pedernales, which continue to receive CONFOTUR incentives.
- Wellness, ayurveda and health tourism concepts that can be integrated into existing resort and spa infrastructure.
- Hospitality technology, including property management systems, revenue management software and digital guest experience platforms.
- Sustainable infrastructure for resorts, including water treatment, waste management and renewable energy systems.

Opportunities for Indian Companies

Indian information technology companies are well positioned to supply hotel management systems, revenue management platforms and digital guest experience solutions to an expanding hotel base. Indian wellness and ayurveda operators can explore management contracts or franchise partnerships with Dominican resorts seeking to diversify their spa and wellness offering.

Indian renewable energy equipment manufacturers and solar EPC firms can supply captive power and water heating systems to hotels seeking to reduce energy costs and meet sustainability commitments. Indian textile and home furnishings exporters, already competitive in linens, terry towelling and furnishings, represent a natural supply category for the hospitality sector.

Indian outbound tour operators can develop the Dominican Republic as a long haul leisure, honeymoon and destination wedding market for Indian travellers, a segment that remains largely untapped in either direction.

Role of CCI India

CCI India can convene a dedicated India-Dominican Republic tourism roundtable bringing together ASONAHORES, MITUR and Indian hospitality, wellness and travel trade associations to identify concrete areas of collaboration. CCI India can support Indian hospitality technology, wellness and renewable energy companies in identifying Dominican hotel groups and resort operators as potential clients or partners. CCI India can also work with Indian outbound tour operators and destination wedding planners to position the Dominican Republic as an emerging long haul destination for the Indian market, an effort that would generate two way tourism traffic rather than a purely one directional investment relationship.

Strategic Recommendations

- Organise a joint India-Dominican Republic tourism and hospitality business roundtable involving MITUR, ASONAHORES and Indian industry associations.
- Facilitate introductions between Indian hospitality technology providers and Dominican hotel groups seeking digital transformation.
- Support Indian wellness and ayurveda brands in exploring partnership or franchise opportunities with Dominican resort operators.
- Promote the Dominican Republic among Indian outbound tour operators as a destination for luxury leisure and destination wedding travel.

7.8 Infrastructure and Construction

Overview

Construction is one of the more dynamic sectors of the Dominican economy, driven by tourism related hotel and resort development, free trade zone and industrial facility expansion linked to nearshoring, ongoing public infrastructure investment in roads and airports, and government supported housing programmes.

Current Market Situation

Construction activity remains closely tied to the tourism investment cycle, with hotel development concentrated in established and emerging tourism poles, and to industrial and logistics facility construction linked to free trade zone expansion, including the land being released as part of the Caucedo programme.

Public infrastructure investment continues under the Ministry of Public Works and Communications, covering road network upgrades, airport expansion and transmission and substation infrastructure to support the growing renewable energy pipeline.

Growth Drivers

- Continued hotel and resort construction in both established and emerging tourism poles.
- Industrial and warehouse construction linked to nearshoring and free trade zone expansion.
- Public infrastructure investment in roads, airports and energy transmission networks.
- Rising demand for hurricane resilient building design and construction techniques given the country's exposure to tropical storms.

Challenges

- Rising costs of imported construction materials and equipment.
- Shortage of skilled construction labour and project management capacity for larger scale developments.
- Need for consistent enforcement of building codes, particularly hurricane resilience standards, across all classes of construction.
- Financing costs for large scale infrastructure and housing projects.

Government Support and Policy Framework

The Ministry of Public Works and Communications (MOPC) leads public infrastructure planning and delivery, frequently through public private partnership structures. Tourism linked construction benefits from the tax incentives available under Law 158-01 and CONFOTUR approval, while government housing programmes seek to expand access to formal housing for lower and middle income households.

Investment Opportunities

- Affordable and middle income housing development aligned with government housing programmes.
- Prefabricated and modular construction technology suited to rapid, cost efficient and hurricane resilient building.
- Building materials manufacturing, including cement, tiles, sanitaryware and steel products.
- Engineering, architecture and construction project management services.

Opportunities for Indian Companies

Indian EPC firms with hospitality, industrial and infrastructure experience can explore direct participation or joint ventures with Dominican developers. Indian building materials manufacturers, particularly in cement, ceramic tiles, sanitaryware and steel, represent a competitive export and manufacturing opportunity, while Indian architecture, engineering and modular construction firms are well positioned to serve the country's need for rapid, hurricane-resilient building solutions.

Role of CCI India

CCI India can facilitate business matchmaking between Indian construction and building materials companies and Dominican developers, contractors and industry associations such as the Asociacion Dominicana de Constructores y Promotores de Viviendas (ACOPROVI).

CCI India can also support technology transfer discussions around prefabricated and modular construction methods suited to the hurricane resilience requirements of the Dominican market, and can help Indian architecture and engineering firms identify project opportunities linked to tourism pole development and free trade zone expansion.

Strategic Recommendations

- Organise business matchmaking between Indian construction and building materials companies and Dominican developer associations.
- Facilitate technology transfer discussions on prefabricated and hurricane resilient construction methods.
- Support Indian EPC and architecture firms in identifying project opportunities linked to tourism and free trade zone expansion.

7.9 Renewable Energy

Overview

The Dominican Republic is pursuing an ambitious energy transition anchored in Law 57-07 on Renewable Energy Incentives, enacted in 2007, and the National Energy Plan 2021-2036, which together set a target of 25 percent renewable generation by 2025 and 30 percent by 2030.

Solar photovoltaic generation has emerged as the principal driver of this transition, supported by a growing pipeline of wind, battery storage and rooftop solar projects.

Current Market Situation

Total installed generation capacity connected to the National Interconnected Electric System stood at approximately 7,120 megawatts in 2025, an increase of approximately 19 percent over the prior year. Solar photovoltaic capacity reached approximately 1,581 megawatts in 2025, accounting for approximately 22 percent of the system, and is projected to rise to approximately 1,907 megawatts by 2027. Wind capacity is projected to reach approximately 582 megawatts by 2027, bringing total non conventional renewable capacity to approximately 2,545 megawatts. Renewable sources, including solar, wind, hydropower and biomass, together accounted for approximately 18 to 23 percent of installed capacity through 2024 and 2025, with the government continuing to pursue the 25 percent target.

Battery energy storage is emerging as a parallel priority, with a tender for approximately 600 megawatts of battery storage advancing to address curtailment of renewable generation and to support grid stability.

Growth Drivers

- Government commitment under the National Energy Plan 2021-2036 to raise the renewable share of generation to 30 percent by 2030.
- Tax incentives under Law 57-07, including tax credits and import duty exemptions for renewable energy equipment and project development.
- Rising cost competitiveness of solar photovoltaic generation relative to imported fossil fuel based power.
- Growing corporate demand from the tourism sector, where hotel operators are increasingly investing in captive solar and storage capacity to manage energy costs.

Challenges

- An ageing transmission and distribution grid that continues to constrain the integration of new renewable capacity and contributes to periodic curtailment.
- High technical and non technical losses in the electricity distribution system, which have historically averaged close to 40 percent.
- Continued need for battery storage infrastructure to manage the intermittency of solar and wind generation.
- Financing costs and permitting timelines for utility scale renewable and storage projects.

Government Support and Policy Framework

The Ministry of Energy and Mines (MEM), the National Energy Commission (CNE) and the Superintendency of Electricity (SIE) share responsibility for energy policy, planning and regulation. Law 57-07 provides tax credits of up to 75 percent for qualifying renewable energy investments, together with import duty exemptions and reduced withholding taxes.

The government has committed approximately USD 450 million between 2025 and 2028 to upgrade transmission and substation infrastructure in support of continued renewable expansion, and battery storage mandates introduced through recent regulatory resolutions require storage integration for new intermittent generation projects.

Investment Opportunities

- Utility scale solar and wind project development, including engineering, procurement and construction services.
- Battery energy storage systems, both utility scale and distributed, to support grid stability and address curtailment.

- Rooftop and distributed solar systems for the commercial, industrial and hospitality segments.

Opportunities for Indian Companies

Indian solar module manufacturers, EPC contractors and renewable energy developers, drawing on India's globally competitive solar manufacturing and project execution base, are well placed to participate in the Dominican Republic's utility scale and distributed solar pipeline. Indian battery storage and power electronics manufacturers can supply the growing battery energy storage tender pipeline. Indian companies with expertise in transmission and distribution loss reduction and smart grid technology can support the modernisation of the national grid, an area of persistent technical need. Indian renewable energy financing and project development expertise, honed in a similarly large and diverse domestic market, is also directly transferable to the Dominican context.

Role of CCI India

CCI India can facilitate structured engagement between Indian solar and battery storage companies and the Ministry of Energy and Mines, the National Energy Commission and private developers active in the Dominican renewable energy market.

CCI India can organise a renewable energy sector business delegation to introduce Indian EPC contractors, module manufacturers and storage technology providers to Dominican project developers and government counterparts, and can support knowledge exchange on grid modernisation and loss reduction given India's own experience in scaling renewable capacity within a large interconnected grid.

Strategic Recommendations

- Organise a renewable energy business delegation connecting Indian solar, wind and battery storage companies with Dominican developers and regulators.
- Support Indian EPC and module manufacturing companies in bidding for utility scale solar and storage tenders.
- Facilitate knowledge exchange on grid modernisation and distribution loss reduction between Indian and Dominican utilities and regulators.

7.10 Mining

Overview

Mining is a significant contributor to the Dominican Republic's export earnings and foreign direct investment inflows, anchored by gold production from the Pueblo Viejo mine, one of the largest gold mines in the Americas, together with ferronickel and copper production from smaller operations.

Current Market Situation

Pueblo Viejo, operated as a joint venture between Barrick Mining Corporation and Newmont, produces more than 800,000 ounces of gold annually and is undergoing an expansion project intended to extend the mine's operating life beyond 2040. Mining exports reached approximately USD 1.07 billion by mid 2025, an increase of approximately 39 percent year on year, with gold accounting for the large majority of export value. Mining represented approximately 1.4 percent of gross domestic product in 2024 while accounting for more than 40 percent of total exports, underscoring its outsized role in the country's external trade despite a comparatively modest direct GDP share.

The sector attracted approximately USD 175 million in foreign direct investment in the first quarter of 2025 alone, and has become the country's third largest foreign currency earner after tourism and remittances. Other notable operations include the Falcondo ferronickel mine and the Cerro de Maimon copper, gold and silver mine.

Growth Drivers

- Continued expansion of the Pueblo Viejo mine and its associated tailings storage infrastructure.
- Sustained gold price strength supporting export revenue and new investment in exploration.
- Government interest in developing strategic mineral and rare earth element resources through the newly established state mining company.

Challenges

- Environmental and community concerns associated with large scale mining, including tailings storage facility development and resettlement processes.
- Regulatory and permitting complexity for new mining projects.
- Limited downstream processing and value addition within the country relative to the scale of raw mineral exports.

Government Support and Policy Framework

Mining sector governance rests with the Ministry of Energy and Mines and the Ministry of Environment and Natural Resources. The Dominican Republic participates in the Extractive Industries Transparency Initiative (EITI) to improve transparency in licensing and revenue reporting.

In August 2024, the government established Empresa Minera Dominicana S.A., a state mining company mandated to explore and develop strategic mineral resources and rare earth elements on behalf of the state, signalling an increased government role in the sector.

Investment Opportunities

- Mining equipment, machinery and maintenance services for existing and future operations.
- Environmental monitoring, water treatment and tailings management technology.
- Exploration and geological services for underexplored mineral prospects.

Opportunities for Indian Companies

Indian mining equipment manufacturers and engineering firms can explore supply relationships with Pueblo Viejo and other operating mines, particularly in areas such as processing equipment, environmental monitoring systems and tailings management technology where India has developed relevant domestic capability. Indian companies with expertise in mineral processing and value addition may also find opportunities to collaborate with the newly established state mining company as it develops its strategic minerals mandate.

Role of CCI India

CCI India can facilitate introductions between Indian mining equipment and environmental technology companies and the Ministry of Energy and Mines, Empresa Minera Dominicana and established mining operators, with a particular focus on environmental monitoring and tailings management technology given the heightened scrutiny these areas currently receive in the Dominican market.

Strategic Recommendation

- Facilitate engagement between Indian mining equipment and environmental technology companies and Dominican mining operators and regulators.
- Explore collaboration opportunities with Empresa Minera Dominicana on strategic minerals development.

7.11 Information and Communication Technology

Overview

The Dominican Republic's information and communication technology sector has expanded steadily, supported by rising internet and mobile connectivity, an established nearshore information technology services industry, and a government led digital transformation agenda.

Current Market Situation

Internet penetration reached approximately 88 to 91 percent of the population in 2025, with mobile connections covering more than 90 percent and 4G coverage exceeding 97 percent. Information technology services revenue is projected to reach approximately USD 738 million in 2025, growing at a compound annual rate of approximately 5 to 6 percent through 2030.

The nearshore information technology services and business process outsourcing model is well established, serving clients across fintech, software as a service, e-commerce, healthcare and logistics verticals, supported by workforce development institutions such as the National Institute for Technical and Vocational Training (INFOTEP) and the Higher Institute of Technology (ITLA).

Growth Drivers

- Continued expansion of nearshore information technology services and business process outsourcing demand from North American clients.
- Government implementation of the Agenda Digital 2030, the national digital transformation strategy.
- Rising smartphone penetration and digital adoption across the population.
- Growing investment in cloud infrastructure, data centres and cybersecurity capacity.

Challenges

- Inconsistent intellectual property enforcement, which affects the operating environment for technology providers and local startups.
- Limited access to high speed, affordable internet connectivity in rural areas.
- Shortage of advanced software engineering, data science and cybersecurity talent relative to industry demand.

Government Support and Policy Framework

The Agenda Digital 2030, coordinated through the Digital Transformation Cabinet, is the government's principal strategic framework for the sector, covering connectivity expansion, digital education, cybersecurity, fintech development and e-government services. Workforce development programmes delivered through INFOTEP and ITLA are expanding technical training in software development, cloud computing and cybersecurity to meet rising industry demand.

Investment Opportunities

- Nearshore software development and information technology services delivery centres.
- Cloud infrastructure, data centre and cybersecurity services.
- Digital skills training and technical education partnerships.

Opportunities for Indian Companies

Indian information technology services companies, drawing on a globally recognised delivery model, can explore establishing nearshore delivery centres in the Dominican Republic to serve North American clients through a Caribbean time zone advantage, potentially in partnership with existing Dominican technology firms.

Indian software product companies can explore the Dominican market directly given rising digital adoption, while Indian cybersecurity and cloud infrastructure providers can support both public and private sector digital transformation initiatives under the Agenda Digital 2030. Indian technical training institutions can also explore partnerships with INFOTEP and ITLA to support workforce development in software engineering and cybersecurity.

Role of CCI India

CCI India can facilitate engagement between Indian information technology services and software companies and Dominican counterparts and government digital transformation authorities, and can support the development of institutional partnerships between Indian technical training institutions and INFOTEP and ITLA to strengthen the digital skills pipeline that both nearshore delivery and domestic digital transformation depend upon.

Strategic Recommendations

- Facilitate exploratory engagement between Indian information technology services companies and Dominican nearshore delivery firms and government digital transformation bodies.
- Support partnerships between Indian technical training institutions and INFOTEP and ITLA in software engineering and cybersecurity.

7.12 FinTech

Overview

Financial technology is one of the priority verticals identified within the Dominican Republic's Agenda Digital 2030, reflecting the government's interest in accelerating financial inclusion and modernising the national payments infrastructure through private sector innovation.

Current Market Situation

The Dominican fintech sector remains at a relatively early stage of development compared to larger Latin American markets, with growth concentrated in digital payments as the primary entry point, alongside an emerging digital investment segment. The digital investment market is projected to reach a market volume of approximately USD 1.9 billion by 2028, reflecting steady but still developing adoption.

The Central Bank of the Dominican Republic has played an active role in shaping this transition through modernisation of the national payments system and development of real time payment infrastructure, though financial and digital inclusion gaps remain, particularly within informal segments of the economy.

Growth Drivers

- Central Bank led modernisation of national payments infrastructure and real time payment rails.
- Government prioritisation of fintech development under the Agenda Digital 2030.
- Rising smartphone penetration and changing consumer payment behaviour.

Challenges

- Persistent financial and digital exclusion in informal and lower income segments of the population.
- Early stage regulatory frameworks for newer fintech categories such as digital lending and digital investment platforms.
- Limited depth of local venture capital and growth financing for fintech startups relative to larger regional markets.

Government Support and Policy Framework

The Central Bank of the Dominican Republic regulates payment systems and has led modernisation of national payments infrastructure, while the Agenda Digital 2030 identifies fintech development as an explicit national priority alongside broader digital economy and cybersecurity objectives.

Investment Opportunities

- Digital lending and credit scoring platforms suited to underserved and informal sector customers.
- Digital investment and wealth management platforms for a growing middle class consumer base.
- Regulatory technology and compliance solutions to support an evolving fintech regulatory framework.

Opportunities for Indian Companies

Indian fintech companies, particularly those with experience serving large underbanked populations through digital lending, credit scoring and financial inclusion focused products, can offer directly relevant technology and business models to the Dominican market.

Indian digital payments infrastructure providers can support continued modernisation of the national payments system, while Indian regulatory technology companies can support Dominican financial authorities in developing supervisory capacity for newer fintech categories.

Indian firms specializing in digital identity, e-KYC, cybersecurity, payment gateways, and API-based financial services can also support the Dominican Republic's ongoing digital transformation by enhancing secure and efficient financial transactions.

Furthermore, collaboration between Indian fintech companies, Dominican financial institutions, and government agencies can facilitate knowledge sharing, capacity building, and the adoption of innovative financial technologies, thereby promoting greater financial inclusion, expanding access to credit for small businesses, and strengthening the country's digital financial ecosystem.

Role of CCI India

CCI India can facilitate structured dialogue between Indian fintech companies and the Central Bank of the Dominican Republic and private financial institutions exploring digital lending, financial inclusion and regulatory technology solutions, positioning India's own financial inclusion experience as a relevant reference point for Dominican policymakers and industry.

Strategic Recommendations

- Facilitate dialogue between Indian fintech companies and the Central Bank of the Dominican Republic on financial inclusion and digital lending models.
- Support Indian regulatory technology companies in engaging with Dominican financial sector regulators on supervisory capacity building.

7.13 Education and Skill Development

Overview

The Dominican education system spans early childhood, primary, secondary and tertiary levels, complemented by a dedicated technical and vocational training system administered through the National Institute of Technical Vocational Training (INFOTEP). Literacy among the population aged 15 and above stands at approximately 94 to 95 percent, and tertiary enrolment has expanded steadily, though gaps in educational quality, teacher retention and vocational programme access remain persistent policy priorities.

Current Market Situation

Secondary school enrolment reached approximately 72 percent in 2023 and tertiary enrolment approximately 55 percent in 2022, reflecting continued gains in educational access. INFOTEP, established in 1980, operates a network of centres offering more than 150 specialised career paths across sectors including automotive mechanics, information technology, hospitality, healthcare, construction and refrigeration, and increasingly delivers training through virtual formats to extend reach beyond Santo Domingo.

Vocational programme enrolment nonetheless represented only approximately 14 percent of secondary level enrolment in 2024, a decline from earlier years, highlighting continued need to strengthen the vocational training pipeline relative to the country's expanding industrial, tourism and technology sectors.

Growth Drivers

- Rising labour market demand for digital, hospitality, technical and industrial skills across expanding sectors such as tourism, nearshore services, construction and renewable energy.
- Government investment in expanding virtual and remote delivery of vocational training to reach underserved provinces.
- Growing private sector engagement in dual training and apprenticeship models coordinated through INFOTEP.

Challenges

- Public education spending below regional benchmarks, constraining investments in teacher quality and infrastructure.
- A persistent digital divide that limits the effectiveness of virtual vocational training in lower income and rural households.
- Skill mismatches between vocational programme output and the specific technical requirements of growing sectors such as information technology, renewable energy and advanced manufacturing.
- Gender gaps in labour market outcomes despite improving educational access for women.

Government Support and Policy Framework

The Ministry of Education oversees primary and secondary education, the Ministry of Higher Education, Science and Technology (MESCyT) oversees tertiary education, and INFOTEP governs the national technical and vocational training system under a competency-based training model adopted in 1998. INFOTEP also provides training, counselling and productivity linked support services to small and medium enterprises alongside its core vocational training mandate.

Investment Opportunities

- Technical and vocational training partnerships in digital skills, renewable energy, advanced manufacturing and hospitality.
- Digital learning platforms and content suited to virtual and blended delivery models.
- Teacher training and curriculum development collaborations, particularly in science, technology, engineering and mathematics disciplines.

Opportunities for Indian Companies

Indian technical training institutions and edtech companies, drawing on India's extensive experience in skill development at scale, can explore partnerships with INFOTEP, MESCyT and Dominican universities to strengthen curricula in information technology, renewable energy, advanced manufacturing and hospitality skills.

Indian companies operating in the Dominican Republic across sectors such as pharmaceuticals, automotive components, renewable energy and information technology can also support sector specific training academies aligned with their own operational skill needs, creating a direct link between investment and workforce development.

Role of CCI India

CCI India can facilitate institutional partnerships between Indian technical training providers and INFOTEP, MESCyT and Dominican universities, with a focus on digital skills, renewable energy and advanced manufacturing training that aligns with the priority sectors identified throughout this Knowledge Paper. CCI India can also support Indian companies establishing operations in the Dominican Republic in developing sector specific training academies in partnership with INFOTEP's dual training model.

Strategic Recommendations

- Facilitate institutional partnerships between Indian technical training providers and INFOTEP, MESCyT and Dominican universities.
- Support Indian companies investing in the Dominican Republic in establishing sector specific training academies linked to INFOTEP's dual training model.
- Explore scholarship and exchange programmes for Dominican students in Indian technical and higher education institutions.

7.14 Climate Change

Overview

Climate change adaptation and mitigation has become a central pillar of Dominican national policy, formalised through a newly strengthened Nationally Determined Contribution, and cuts across nearly every sector examined in this chapter, from agriculture and tourism to water resources and coastal infrastructure.

Current Market Situation

The Dominican Republic submitted its updated Nationally Determined Contribution, NDC 3.0 RD-2025, in 2025, raising its greenhouse gas emissions reduction target to 28 percent by 2030 and 32 percent by 2035 relative to a business-as-usual scenario, an increase in ambition from the 27 percent 2030 target set in the country's previous NDC.

The updated NDC incorporates 41 adaptation measures and 155 targets spanning seven priority sectors, including water resources, agriculture, health, tourism, and coastal and marine resources, and Dominican authorities estimate that full implementation will require more than USD 23.7 billion in investment from a combination of domestic resources, international cooperation, private investment, and dedicated climate finance.

Growth Drivers

Implementation is being driven by the National Council for Climate Change and the Clean Development Mechanism, which coordinates climate policy across government institutions, continued technical and financial support from the World Bank, which is supporting formulation of the country's Long-Term Strategy targeting climate neutrality by 2050, and the country's acute physical exposure to hurricanes, coastal flooding, and drought, which sustains high level political attention to adaptation financing.

Challenges

Mobilising the estimated USD 23.7 billion in investment required for full NDC implementation represents a substantial financing gap relative to current domestic and international climate finance flows, and coordinating adaptation action across the many sectoral ministries and agencies identified in the NDC, several of which are examined individually elsewhere in this chapter, requires sustained institutional capacity that continues to develop.

Government Support and Policy Framework

The National Council for Climate Change and the Clean Development Mechanism (CNCCMDL), together with the Ministry of Economy, Planning and Development, leads implementation of the NDC 3.0 and the National Climate Change Adaptation Plan, while the Ministry of Environment and Natural Resources oversees complementary environmental regulation. The country's Long-Term Strategy, currently under formulation with World Bank support, targets climate neutrality by 2050 and is intended to guide long-term low-carbon and climate-resilient development planning.

Investment Opportunities

Investment opportunities span the NDC's seven priority adaptation sectors, and include climate resilient infrastructure and early warning systems for coastal and water resources, renewable energy and energy efficiency solutions supporting the mitigation targets described in the renewable energy chapter of this paper, and climate risk assessment and adaptation planning services to support the substantial financing mobilisation task facing Dominican authorities.

Opportunities for Indian Companies

Indian renewable energy, climate resilient infrastructure, and climate risk advisory companies, many with relevant experience gained through India's own extensive climate adaptation and mitigation programming, are well positioned to support Dominican implementation of the NDC 3.0 across the water resources, agriculture, coastal infrastructure, and renewable energy sectors identified as priorities.

Role of CCI India

CCI India can help position Indian renewable energy, climate resilient infrastructure, and climate advisory companies as partners in Dominican NDC 3.0 implementation, engaging directly with the National Council for Climate Change and the Clean Development Mechanism.

CCI India can also support Indian companies in identifying international climate finance instruments, including multilateral climate funds, that are expected to underwrite a portion of the country's USD 23.7 billion implementation requirement.

Strategic Recommendations

- Engage directly with the National Council for Climate Change and the Clean Development Mechanism to position Indian companies across the NDC 3.0's seven priority adaptation sectors.
- Support Indian renewable energy and climate resilient infrastructure companies in identifying opportunities linked to the country's Long-Term Strategy and 2050 climate neutrality target.
- Help Indian climate risk advisory and project development companies access international climate finance instruments relevant to Dominican NDC 3.0 implementation.

Chapter 8: Major Challenges and Cross-Cutting Constraints

8.1 Climate Change and Natural Disaster Vulnerability

The Dominican Republic's exposure to hurricanes, coastal flooding, and drought, and the substantial USD 23.7 billion investment required to implement its updated Nationally Determined Contribution, represent a constraint that touches agriculture, tourism, infrastructure, water resources, and coastal development alike.

How CCI India Can Contribute

CCI India can position Indian renewable energy, climate resilient infrastructure, disaster risk reduction, and climate advisory companies as long-term partners in Dominican adaptation and mitigation efforts, and can help Indian companies access the international climate finance instruments expected to underwrite much of the country's implementation cost, rather than treating climate cooperation as a standalone theme separate from mainstream trade and investment engagement.

8.2 Human Capital and Skills Gaps

Shortages of specialised technical, quality assurance, and professional skills recur across the healthcare, medical device manufacturing, information technology, and manufacturing sectors examined in this paper, constraining the absorptive capacity of Dominican industry for new investment and technology even where market demand exists.

How CCI India Can Contribute

CCI India can convene Indian educational and vocational training institutions with Dominican counterparts, including INFOTEP and relevant university partners, to develop sector-specific training partnerships in the areas of greatest need identified in Chapter 7, and can support the placement of Indian technical trainers and curriculum expertise within existing Dominican capacity building programmes rather than proposing entirely new parallel initiatives.

8.3 Digital Transformation and Infrastructure Gaps

Uneven digital infrastructure, nascent fintech regulation, and limited digitisation of small business operations constrain the pace at which the Dominican economy can adopt the digital tools that Indian companies, particularly in payments, e-commerce enablement, and enterprise software, are well placed to supply.

How CCI India Can Contribute

CCI India can support Indian digital public infrastructure and fintech companies, several of which have deployed comparable solutions at scale in India, in engaging with Dominican regulators and financial institutions on pilot digitisation projects, and can help translate India's own digital public infrastructure experience into a form relevant to Dominican institutional capacity.

8.4 SME Financing and Financial Inclusion

Small and medium enterprises across the sectors examined in this paper, from smallholder cocoa and agricultural producers to apparel subcontractors and technology startups, consistently report financing access as a binding constraint on growth and modernisation.

How CCI India Can Contribute

CCI India can facilitate dialogue between Indian financial institutions, export credit agencies, and development finance partners and Dominican counterparts on blended finance and supplier credit mechanisms that could accompany Indian equipment, technology, and input sales into the Dominican market, directly supporting the SME financing gap identified across multiple sector chapters.

8.5 Manufacturing and Export Competitiveness

Dominican manufacturing, including the medical device, textile, and light manufacturing sectors examined in Chapter 7, remains concentrated in assembly and contract manufacturing activity rather than higher value design and product development, and faces intensifying competition for nearshoring investment from other Latin American and Caribbean jurisdictions.

How CCI India Can Contribute

CCI India can position Indian capital goods, machinery, and component suppliers as partners in upgrading Dominican manufacturing value addition, and can support structured dialogue between Indian manufacturers and Dominican free trade zone authorities on opportunities to deepen local production beyond assembly, consistent with the recommendations set out in the manufacturing and auto components sections of this paper.

8.6 Tourism Sustainability and Economic Diversification

The Dominican Republic's tourism sector, while a considerable success story, faces sustainability pressures from infrastructure strain, coastal environmental degradation, and a business model heavily weighted toward all-inclusive resorts with limited spending leakage into local communities, alongside a broader economic reliance on tourism that underscores the importance of the diversification into pharmaceuticals, agriculture, manufacturing, and technology that this paper otherwise addresses.

How CCI India Can Contribute

CCI India can support Indian sustainable tourism infrastructure, waste and water management, and hospitality technology companies in engaging with the Dominican tourism sector's sustainability agenda, while more broadly using the trade and investment cooperation set out across this paper to help diversify the Dominican economy's productive base beyond tourism dependence.

Chapter 9: Role of CCI India: Strategic Institutional Framework

9.1 Trade and Investment Promotion

CCI India can serve as the principal Indian industry-side counterpart for bilateral trade and investment promotion, disseminating market intelligence on Dominican sector opportunities of the kind compiled in this paper to its member companies, supporting export promotion for Indian goods and services with a genuine market fit in the Dominican Republic, and encouraging Indian investors to evaluate the country's free trade zone and CAFTA-DR access advantages as a Caribbean and Central American investment platform rather than solely as an export destination.

9.2 Business Delegations, B2B Matchmaking, and Trade Fairs

CCI India can organise structured, sector-focused business delegations to the Dominican Republic and reciprocal visits by Dominican industry representatives to India, curated around the specific sector opportunities identified in Chapter 7 rather than general-purpose trade missions, and can support participation by Indian companies in relevant Dominican trade fairs, buyer-seller meets, and investment forums, working alongside the Embassy of the Dominican Republic in India and Dominican sector associations such as Adozona, CONACADO, and INTABACO referenced throughout this paper.

9.3 Technology Transfer and Industrial Partnerships

CCI India can facilitate technology transfer and joint venture discussions in the specific areas identified across this paper, including farm mechanisation, food processing, medical device component supply, pharmaceutical manufacturing, and free trade zone based light manufacturing, helping Indian companies move beyond arm's length export relationships toward deeper industrial partnerships that benefit from Dominican CAFTA-DR market access.

9.4 Policy Dialogue and Institutional Mechanisms

CCI India can engage directly with the institutional mechanisms already in place for India-Dominican Republic cooperation, most notably the Joint Economic and Trade Committee established in March 2024 referenced earlier in this paper, ensuring that industry priorities inform the Committee's agenda, and can pursue complementary institutional arrangements, including memoranda of understanding with Dominican chambers of commerce and sector associations and a recurring annual economic dialogue between CCI India and Dominican industry counterparts.

9.5 MSME, Startup, and Innovation Collaboration

CCI India can support structured engagement between Indian micro, small, and medium enterprises and their Dominican counterparts, recognising that much of the opportunity identified in this paper, from agricultural cooperatives to apparel subcontractors, sits at the MSME scale, and can facilitate startup and innovation collaboration linking Indian technology startups with the nascent Dominican startup ecosystem described in Chapter 7.

9.6 Inclusive Entrepreneurship, Skill Development, and Research Partnerships

CCI India can support women's and youth entrepreneurship collaboration between Indian and Dominican business networks, sponsor skill development partnerships in the specific technical areas identified in Chapter 8, and facilitate research and university partnerships between Indian and Dominican academic institutions, particularly in agricultural science, medical and nursing education, and engineering disciplines relevant to the priority sectors examined in this paper.

CCI India can also promote innovation and startup collaboration by connecting incubators, accelerators, and entrepreneurship support organisations from both countries to encourage joint ventures and technology exchange. Organising academic exchanges, internship programmes, innovation challenges, and collaborative research initiatives would strengthen people-to-people ties while developing a skilled workforce aligned with the evolving needs of priority sectors. These initiatives would contribute to long-term institutional cooperation, knowledge sharing, and sustainable economic development between India and the Dominican Republic.

9.7 Priority Sector Coordination

CCI India can maintain dedicated coordination across the highest priority sectors identified through the Ambassador and Director General's discussions, namely pharmaceuticals, healthcare, agriculture and farm mechanisation, logistics, cocoa, cigars, and textiles, ensuring that the detailed sector recommendations set out in Chapter 7 translate into sustained institutional follow-up rather than one-time introductions, while continuing to identify emerging opportunities in renewable energy, fintech, and digital economy cooperation.

CCI India can further strengthen these efforts by establishing sector-specific working groups, facilitating regular business delegations, and organising targeted B2B meetings between Indian and Dominican enterprises. Periodic progress reviews, market intelligence updates, and collaboration with relevant government agencies, industry associations, and chambers of commerce would help address implementation challenges and identify new investment opportunities. Such a structured engagement mechanism would ensure continuity, deepen institutional partnerships, and enhance the long-term impact of bilateral economic cooperation.

9.8 Climate Cooperation and ESG

CCI India can position climate cooperation and environmental, social, and governance considerations as a cross-cutting dimension of India-Dominican Republic engagement rather than a standalone theme, consistent with the approach set out in Chapter 8, supporting Indian renewable energy, water, and waste management companies in aligning their Dominican market engagement with the country's Nationally Determined Contribution and broader sustainability commitments.

CCI India can also encourage collaboration in green technology transfer, sustainable infrastructure development, and climate-resilient agriculture by facilitating partnerships between Indian companies, Dominican government agencies, research institutions, and private sector stakeholders. Organising sustainability-focused trade missions, technical workshops, and investment dialogues would help identify commercially viable climate solutions while promoting responsible business practices. These initiatives would strengthen bilateral cooperation in the green economy and support the Dominican Republic's transition towards low-carbon and sustainable development.

Conclusion

This Knowledge Paper has sought to demonstrate, sector by sector, that the opportunity is both real and specific: a Dominican Republic reorienting its manufacturing base toward medical devices and higher value free trade zone production, expanding healthcare and pharmaceutical access, deepening its position within global nearshoring trends, and pursuing an increasingly ambitious climate and sustainability agenda, and an Indian industry base, spanning pharmaceuticals, agriculture, manufacturing, renewable energy, and digital services, that is well positioned to be a partner in each of these transitions.

The analysis presented across this paper indicates that the most productive path forward lies not in broad, undifferentiated trade promotion, but in the sector-specific, institutionally grounded engagement outlined in Chapters 7 through 9, anchored by the Joint Economic and Trade Committee and given sustained institutional expression through CCI India's own programming. Progress will depend on consistent follow-through: converting the introductions, delegations, and technical briefings recommended throughout this paper into durable commercial relationships, joint ventures, and institutional partnerships over the coming years.

CCI India is well placed to serve as the principal Indian industry institution driving this agenda forward, in close partnership with the Embassy of the Dominican Republic in India, the Government of India, and Dominican sector authorities and associations identified throughout this paper. With sustained commitment from both sides, the India-Dominican Republic economic relationship can grow into one that reflects the full scale of opportunity between two economies whose complementarities, as this paper has demonstrated, are considerably greater than their current level of engagement.

THANK YOU

CCI India sincerely thanks Your Excellency for the warm hospitality and gracious interaction with our team. We greatly value the opportunity to discuss strengthening India-Dominican Republic bilateral trade and economic relations and look forward to deepening cooperation, expanding business engagement, and creating new avenues for trade, investment, and mutually beneficial partnerships between the two countries.

The background of the entire page features the Indian national flag (Tiranga) on the left and the Honduran national flag on the right, both waving against a light blue sky with soft white clouds. The Indian flag has horizontal stripes of saffron, white, and green, with the Ashoka Chakra in the center. The Honduran flag has five horizontal stripes of blue, white, red, white, and blue, with the national coat of arms in the center.

Trade Opens Markets; Partnerships Build the Future.
